Continuation of 11. does NOT place the application in condition for allowance because: Applicant's arguments with regards to the Objection to the Specification and the 35 USC 112, 1st rejection have been considered and are persuasive. The Objection and the Rejection have been withdrawn.

Applicant's prior art arguments have been considered and are not persuasive.

Applicant argues that the properties desired of the platinum black air cathode for producing ozone of Solomon are not the same properties required for the negative electrode. Applicant argues that the Office has not provided proper rationale supporting its position. In response, although Solomon's invention pertains to a cathode and not an anode, it is noted that both Solomon and Nobufumi pertain to the art of battery and thus, the combination is proper. Further, because applying the process of Solomon would entail predictable results, it is noted that the combination would have been obvious to one of ordinary skill in the art.

Regarding Applicant's arguments regarding Battery B5, the Examiner notes that the current collector used b2 in Table 13 was not surface-roughened and was not sintered above the melting temperature.

Regarding Applicant's arguments on criticality, it is noted that the combination of prior art has been found to structurally read on the instant claims, and thus inherently possesses the claimed properties.
